Yeastar

Yeastar Cloud PBX

Future-proof Hosted Business Phone System

Yeastar Cloud PBX is a fully-featured cloud-based phone system ideally suited for SMEs. Besides efficient call communication, rich telephony features, desktop softphone, BYOD mobility, IM, presence, unified messaging and CRM integration are all at your disposal. With 100% hosted deployment, there is no upfront hardware cost and the in-house management overheads are reduced to almost nothing.

Scale Capacity at Your Preference

Yeastar Cloud PBX allows for increases in capacity needs with business growth, including the number of users and concurrent calls. That means your business phone system is primed for future growth and you only pay for what you actually need for the moment.

Streamlined Administration and Management

Administration of your Cloud PBX is a breeze with an intuitive and effective web GUI. IT admins can easily manage user accounts while each user controls individual settings. Making upgrades only requires a few clicks right from the web interface. Plug & play compatibility with mainstream IP phones ensures hassle-free setup and scalability.

Enjoy Rich PBX Features In the Cloud

With most hosted solutions you may have to give up many of your favorite features. But that's not the case for Yeastar Cloud PBX. Delivering a comprehensive set of business communications features, Yeastar Cloud PBX ensures that various business needs are met in the most effective and user-friendly way.

Stay Connected with Linkus Anywhere Anytime

Linkus UC Client is a Unified Communications App for Windows desktop, Mac desktop, iPhone and Android phone. It functions as an office extension so that you can place calls, set up call forwarding, check voicemails and access call history across multiple devices. Better yet, rich consolidated collaboration features are going to take the work efficiency to the next level.

Multi-site Friendly Business Phone System

With Yeastar Cloud PBX, you are able to unify your headquarter with remote offices and a handful of teleworkers, within a single PBX system, giving geographically dispersed employees the same features and continuity as in-house users. Offices on opposite sides of the world can then communicate as if on the same floor of one office building.

Embedded business-enhancing features to drive productivity
